

Zion National Park Vegetation Map Class for Perennial Disturbed Grassland Complex

The map class "[Perennial Disturbed Grassland Complex](#)" is composed of the following vegetation associations, each described separately:

- [Bromus inermis - \(Pascopyrum smithii\) Semi-natural Herbaceous Vegetation](#)
- [Poa pratensis Semi-natural Seasonally Flooded Herbaceous Alliance](#)

This map class is common in old agricultural fields, pastures, road-sides, and other heavily disturbed areas. The presence of semi-natural grasses along with annual forbs yields a multitude of variation in the photo signature. This can vary from bright green in high moisture, high growth areas to dark brown and gray in arid and dormant sites. Typically this map class may be confused with other herbaceous types especially native grasslands.
